

MOVING CONCENTRATED FLUIDS TO CUT DOWN YOUR PROCESSING COST

Water is precious. Saving water has become paramount in industrial processes. Scarcity and costs trigger the need to convey ever more concentrated fluids.

SYFLEX series can transfer highly concentrated fluids eliminating the need to add water to enable pumping. This allows for greater water and associated cost savings by minimizing infrastructures and reducing filtration costs.

CUT DOWN MAINTENANCE TIME AND COST

By nature, peristaltic pumps are easy to maintain thanks to their seal-less construction, and as the only wetted part is the hose. SYDEX substantially improved the technology with an optimized hose life time, a smart quick release system which eases the hose change and the internal bearing to cut drive related maintenance.

DESIGNED TO LAST IN THE TOUGHEST ENVIRONMENTS

To provide robust and durable efficiency, SYFLEX has been designed to sustain both internal and external wear factors, whether they are chemical or mechanical.

SYDEX: SYFLEX PERISTALTIC PUMPS

The ideal choice to reduce maintenance costs.

› Principle of PERISTALTIC PUMPS technology

The peristaltic pumping principle is based on the capacity of a soft elastomer hose to accept a deformation and subsequently recover its initial shape. Peristaltic pumps are provided with high pressure hoses, covering a wide range of applications which need versatility and flexibility.

The flow rate is proportional to the pump speed, easily adjustable via energy efficient variable speed drive.

PERISTALTIC PUMPS BENEFITS

› One pump for all fluids

- Abrasive and high solids content slurries up to 80%
- High Density
- Corrosive
- Shear sensitive
- Viscous
- Multiphase/gaseous
- Crystalizing

› Optimized design for tough applications

- Only one wearing part: the hose
- Easy on-site maintenance and short downtimes thanks to a unique hose quick release allowing hose change in only a few minutes
- Seal-less design: no expensive sealing to replace and no associated seal-water flushing costs
- Low energy requirements thanks to the inherent low running speed

› One pump for all tasks

- Transfer, dosing, emptying
- Self-priming
- High suction lift
- Reversible
- Can run-dry and needs no ancillary protection equipment

› Disaster / contamination proof technology

- Seal-less
- Only one wearing and wetted part: the hose

SYDEX: SYFLEX

SF10 – SF12 – SF15 – SF18 – SF25 – SF35 – SF45 – SF55 – SF65 – SF80 – SF100 – SF65Dual – SF80Dual – SF100Dual series

› High quality hoses

› Robust design

- Shock resistant heavy cast X-cover design.
- Improved ergonomic design with accessories connected at the pump back.

› Disaster and contamination proof design

100% leak proof body to hold the fluid in case of hose rupture:

- Double seal and bearing barrier
- Integrated buffer zone
- Sheath around connection

› Compact footprint

Thanks to the integrated bearing design SYFLEX fits one of the smallest footprints on the market.

› Plug-in drive system and long-lasting drive thanks to the integrated bearing technology

The integrated bearing eliminates load on gear motor bearings and favors heat dissipation; bare-shaft assembly for easy coupling with major motor manufacturers. No drive alignment is required.

› Progressive hose compression to extend hose life

Thanks to our unique lemon shaped rotor and deflector design.

› Customized shimming for an even and optimized hose compression

To grant a perfect hose compression and long service life, every SYFLEX is individually shimmed to perfectly match your pumping conditions.

Stainless steel hatch

- Easy shoe shimming adjustment to accommodate new conditions
- Inspection and oil refilling port
- Made of stainless steel

› Easy connection quick release system

Our simple yet ingenious pull-out system allows fast connection removal and easy hose change even after hours of operations on sticky products.

HIGH QUALITY HOSES

High quality hoses from a premium elastomer pump manufacturer.

We understand the critical role elastomers play in our product – which is why our R&D Department have developed a unique elastomer formulation for the pump.

SYFLEX series hoses are available in natural rubber (NR), EPDM and black food NBA. Made of premium quality rubber elastomer with braided reinforcement for additional strength, the manufacturing tolerance is highly controlled providing even-wall thickness and maximizes tube service life.

- **NR:** NR hoses are suitable for very abrasive applications such as clay sludge, lime milk or non-organic products. NR hoses are able to withstand temperatures ranging from -20°C / -5°F.
- **EPDM:** EPDM hoses are suitable for corrosive chemical fluids such as acids or solvents. These are robust hoses made of EPDM rubber and coated with a natural rubber (NR) layer. They are able to withstand temperatures ranging from -10°C / 14°F to 90°C / 194°F.
- **Black nitrile food – NBR:** NBR food hoses are reserved for the food industry for applications such as fruit transfer with chunks or organic waste. FDA 21CFR177.2600 and CE 1935/2004 certifies they are able to withstand temperatures ranging from 0°C / 32°F to 90°C / 194°F.

SYDEX offer in function of the characteristics of the application:

	Natural rubber (NR)	EPDM	Black food nitrile (NBA)
Corrosive	✓	✓ ✓ ✓	✓
Abrasive	✓ ✓ ✓	✓	✓ ✓
Food contact	-	-	✓ ✓ ✓
Heat resistance	✓	✓ ✓	✓ ✓

ACCESSORIES

1 Hose leak detector

In the case of a rupture of the hose, the fluid empties into the chamber and the level of fluid inside the pump rises. The accessory detects the rupture and the pump stops.

4 Pulsation dampener

The pulsating nature of the flow of peristaltic technology may require piping and systems along the entire process line (valves, flowmeter...). Different types of dampers can be used to reduce pulsation peaks and to linearize the flow rate.

The shock absorber

The on-line shock absorber

2 OIL draining connections with manual valve (See DUAL)

In the case of a plant with several space constraints or for Dual pump, it allows the draining of the oil present in the pump chamber thanks to a manual valve.

5 Integrated frequency inverter

The variable frequency can be used to adjust the speed of the drive. Thanks to this, the pump can provide a variable flow range in order to meet the application requirements.

3 Vacuum system

In the case of a highly viscous fluid, the hose tends not to return to its original shape quickly. The vacuum system allows the hose to regain its shape after the shims crush it. This helps maintain the suction power of the pump and does not lose flow. In the case of a Food application, the vacuum system is done with a vacuum pump.

Set of stator caps with vent (security caps)

In the event of an undetected tube rupture, the fluid empties into the chamber and the fluid level inside the pump rises. To avoid overpressure inside the chamber, the cap opens to allow the fluid to escape.

ABRASIVE SLURRIES HIGH DENSITY HIGH SOLIDS CONTENT LESS WATER

Abrasive slurries are among the most challenging fluids to pump. Besides abrasion, their thick, corrosive and high solids content nature put heavy stress on most pumps wetted parts entailing excessive wear, high maintenance costs and costly shutdowns.

Pump selection is therefore critical to ensure constant productivity and reduced operational costs.

SYFLEX series allow you to gain control on both process and costs.

- High Solids Content capabilities up to 80% eliminate the need to dilute slurries, directly translating into great savings on water and subsequent filtration costs and infrastructures
- Easy control of the flow rate by simply acting on the pump speed with no compromise on pump efficiency or fluids density
- Pump operation and efficiency are not affected by variations in solids content, viscosity, or pressure
- Rugged design for long service life in the toughest environments. The only wearing part is the hose. Made of high-quality abrasion resistant elastomer it provides for thousands of working hours.

THICKENER UNDERFLOW / SLURRY

Underflow recoveries from high rate or paste thickener are density sensitive processes. SYFLEX series ability to move abrasive and high solids content slurries enable great control of fluids density in the thickener while greatly reducing water consumption and related costs.

LIME MILK

Lime milk dosing to restore pH in Acid Mine Drainage or in Waste Water Treatment applications entails accurate metering of viscous and abrasive fluids. With high suction lift and no valves to clog, SYFLEX series ensure free fluid passage and long-term reliability.

GROUTING

Grouting pumps used in tunnel boring machines call for reliable and heavy-duty pumps. The sturdy construction of SYFLEX series is well-suited for operating in tough environments and brings maintenance costs to a minimum for pumping abrasive mortars or bentonite slurries.

VISCOUS

SHEAR SENSITIVE FRAGILE PARTICLES

As the shoes compress the hose and propel the fluids forward, the perfect compression and recovery of the hose induces a powerful suction lift while also preventing backflow. The absence of backflow coupled with the low inherent working speed of SYFLEX series provides a gentle pumping action, preserving the texture of the most fragile, shear-sensitive and viscous fluids.

Upon hose recovery a strong vacuum draws the fluids into the pump hose; contained between the two shoes, large particles* can therefore also be transferred with minimal damage and flow smoothly with no risk of clogging valves or turning the pump into a filter.

(*Soft particles with sizes up to the hose bore diameter and hard particles up to a third of the hose bore diameter)

FLOCCULANTS

The gentle pumping action of SYFLEX series makes them ideal for the most fragile, shear sensitive flocculants. By preserving flocculants texture, their consumption can be reduced and minimize your costs while it provides high settling rates in thickeners.

BIOMASS

Biomass processes often create challenging situations ranging from chemical attack, varying pumping condition or solids handling. SYFLEX series have proven highly efficient for moving materials with varying consistencies or containing large particles.

WHOLE PIECES

SYFLEX series pumping principle allows the transfer of soft and hard particles such as algae used to produce energy, or wood chips in the Pulp and Paper industry. Particles are conveyed with minimal damage while the free passage within the rubber hose ensures trouble-free uptimes.

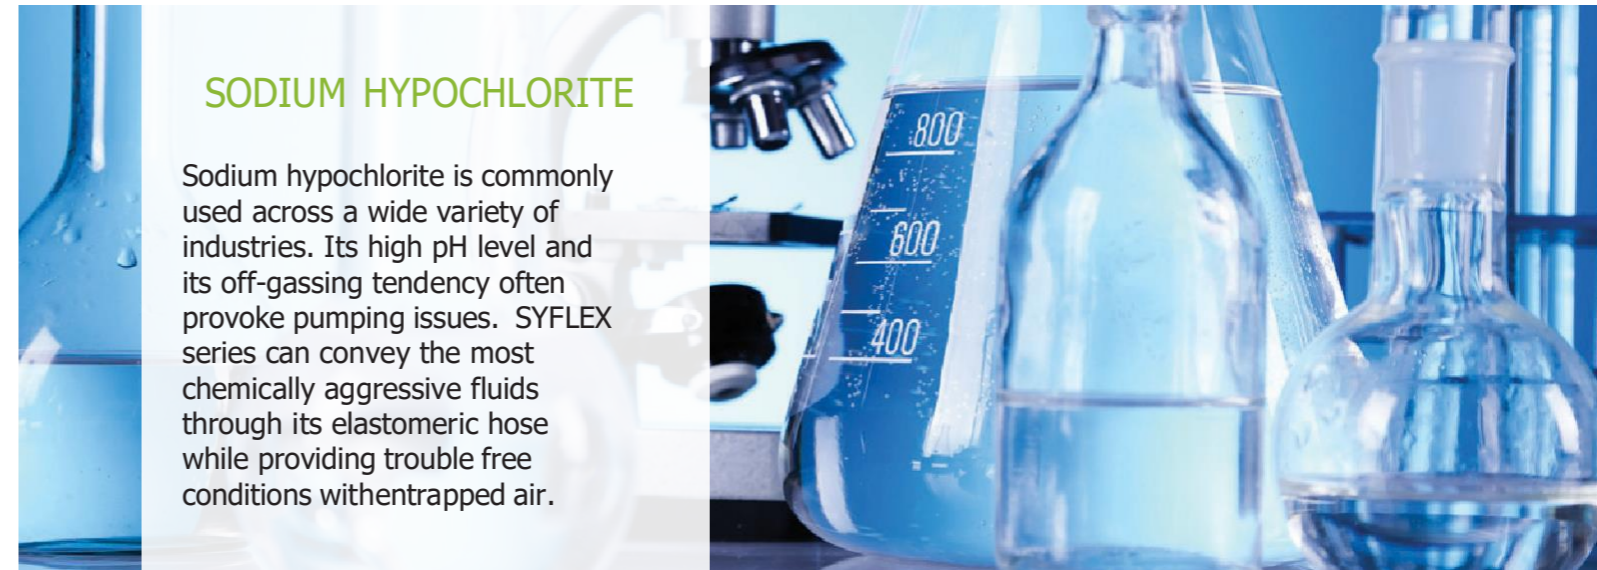

DOSING OF CORROSIVE & GASEOUS FLUIDS

AIR ISSUES DRY RUNNING

Unlike most other pump technologies, the pumped fluids only make contact with one single part: the inner wall of the hose. The absence of metallic parts makes SYFLEX series ideal for dosing corrosive chemicals with minimal maintenance costs.

Entrained air can cause air sensitive or air intolerant pumps to generate high maintenance costs as a result of hammering vibrations or even lead to entire process shut down in case of air-locked impellers, while SYFLEX convey the entrained air transparently providing you with constant productivity.

Further to preventing leaks to the environment, SYFLEX series seal-less design also means there is no air ingress likely to contaminate the pumped fluids.

SODIUM HYPOCHLORITE

Sodium hypochlorite is commonly used across a wide variety of industries. Its high pH level and its off-gassing tendency often provoke pumping issues. SYFLEX series can convey the most chemically aggressive fluids through its elastomeric hose while providing trouble free conditions without trapped air.

ACIDS

Highly corrosive fluids such as sulphuric or hydrochloric acids require chemical resistant pumps to ensure constant productivity. With SYFLEX series, corrosive fluids are only in contact with a chemically inert elastomer hose. In addition, the seal-less design also prevents spillage and environment contamination.

CERAMIC / PAINT

SYFLEX series seal-less design eliminates the risk of air ingress during operations. They are ideal for dosing air-sensitive fluids such as those found in the Ceramic industry or for recirculating paints that cannot tolerate air contamination.

THE FOOD MARKET: FRAGILE SENSITIVE AND ABRASIVE

Peristaltic pumps SYFLEX cover a wide range of food applications requiring versatility and flexibility. Easy to use and maintain, this solution adapts to multiple stresses of abrasiveness and respect for textures. A food nitrile hose (CE 1935/2004 and FDA certified) has been developed to meet the requirements of these applications.

With a low operating speed and a smooth passage through the hose, peristaltic pumps are ideal for transferring abrasive products such as spent grains, crushed meat juices containing bone debris... They also ensure the safe transfer of fragile products (fruit pieces or slaughterhouse residues in the recovery of by-products).

SYFLEX peristaltic pumps offer the following benefits:

- self-priming
- dry running
- reduced overall cost of use (single wearing part – the hose)

The ease of maintenance of the peristaltic pump is a key factor appreciated by site operatives – tube changes can be done within minutes.

VISCERA TRANSFER

The transfer of by-products (e.g., poultry visceral and gizzard) requires respect for the integrity of the pieces. These may be of different sizes depending on the poultry (chicken, turkey...). The objective is to preserve them for resale as by-products of first choice in different animal feed chains such as Petfood or Seafood. SYFLEX solution offers two major advantages for this application: a high suction power and the assurance that the pieces are respected when they are transferred.

ABRASIVE APPLICATIONS

The SYFLEX pumping principle allows the transfer of soft and hard particles such as fruit preparations, compotes, jams, and other vegetables purees, sometimes abrasives (presence of seeds or peels). The different pieces are also transported without damage, which allows our customers to retain the desired texture depending on the application and the final product.

ACID OR CORROSIVE FLUID

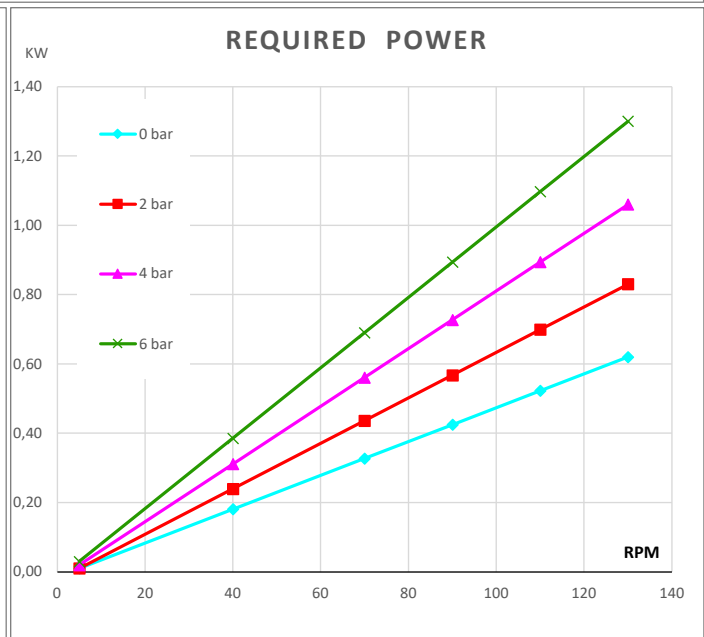

Only the elastomer hose is in contact with the fluid. This eliminates all the corrosion problems usually encountered with acidic (hydrochloric, sulphuric, nitric...) or alkaline (solder, detergents...). In addition, the leak-free design prevents the risk of leakage and contamination of the environment. SYFLEX pumps are suitable for the transfer of dyes or phosphoric acids, particularly used in the manufacture of pet food products (petfood - dry products.)
